

Username: Mukesh Khanna

Class Code: ce3403-8N6H

Enrollment No: 12123

Subject Code: 12345

Branch: CE

Subject: ShreeRam

Year: 2nd

Faculty Name: Jayram

Session Info:

1) Question: Explain string indexing and slicing with examples.

Answer: String indexing and slicing are used to access the elements of that string. It is very useful to access the words or sentences. It can be work as if I'm passing one word which have 5 letters and I want to print only first letter then I use indexing. And if I want to print from first letter to 3rd letter, I would use slicing. It would be very efficient when we are accessing the specific characters or specific words.

2) Question: What is the purpose of the backslash \ in Python strings?

Answer: Uh, the purpose is to create the path or to enter the path.

3) Question: Which operator is used for string concatenation in Python?

Answer: The plus operator is used for string concatenation in Python.
